

Overview of Bats and Industrial Wind Turbines

Some interesting facts about bats:

- a) bats are prodigious insect eaters as each bat can consume its **entire body weight** of insects *every day*,
- b) bats are not only critical to agriculture due to their powerful insect control, but also as pollinators and seed distributors,
- c) bats make up about one fifth of the world's mammal population,
- d) there are 1200± species of bats worldwide, and 45± species in North America,
- e) the [White Nose Syndrome](#) (WNS) only affects about three (3) species of bats,
- f) WNS originated in upstate New York, so its worst effects are in the Northeast,
- g) the fact that WNS has killed high numbers of certain bats, makes the remaining bats *much* more valuable – not only to agriculture, but to the entire ecosystem,
- h) the wind industry has not been able to come up with any meaningful way to prevent high quantities of bats deaths (other than shutting down the turbines).
- i) Some sample additional sources of bat info: [here](#), [here](#), [here](#) and [here](#).

There are numerous studies and reports that have verified: **a)** the importance of bats, and **b)** their wholesale killing by wind turbines. These are some examples, recently published in the monthly *Energy & Environmental Newsletter*:
